

Soma

Learning to read the body, one sensation at a time.

Bubble Team

Claude ADHD Hackathon · Midpoint submission · 6 Sept

The problem

ADHD brains lose the signal before the storm.

People with ADHD often can't feel emotion building until it's overwhelm. The early bodily cues — the tight jaw, the buzzing chest — go unnoticed until it's too late to self-regulate.

And the tools meant to help make it worse: text-heavy, streak-driven, shame-inducing. They demand the exact sustained attention ADHD doesn't have.

The insight

Two ideas, bridged.

- *Interoception* — the sense of the body's inner state — is the missing skill. It can be trained.
- *Internal Family Systems (IFS)* gives a non-shaming language for inner experience: not "my anxiety," but "a part of me."
- The bridge: a felt sensation in the body is the doorway to a part. Notice the sensation, meet the part.

Meet Soma

A quiet place to notice.

Soma is a near-wordless app. You check in, map what you feel onto your body, and meet the part it belongs to — with an AI companion that never judges, never scores, never rushes.

**No streaks. No badges. No fixing.
Just noticing.**

The core loop

Sensation, body map, named part.

One spine runs through the whole app. The body map isn't a feature — it's the interface for discovering parts. You feel something, you place it on the body, and Soma helps you name the part living there.

Felt sensation

Mark on the body

the bracer

A named part

Start with the body, not words.

How are you feeling?

tight

buzzing

heavy

far away

INNER WEATHER

stormy

clear

Check in

Tap a mood, or choose your inner weather — stormy to clear. Two taps, no typing.

Where do you feel it?

chest · buzzing

jaw · tight

Body map

Tap anywhere on a full body outline to place a sensation, then shape it: colour, texture, movement. The felt sense, made visible.

Meet your parts. Watch your week.

Soma

Talk to your AI companion in plain language. It only records what you say, and can guide a short practice.

Dashboard

Your window of tolerance over the week, and your parts as living characters you can revisit.

What makes it different

Designed against the grain.

Body-first, not text-first

Regulation starts below language.

Anti-gamification, on purpose

No streaks or scores, because for ADHD those breed shame.

Parts as characters

Your inner world is populated, not pathologised.

Window of tolerance

We track regulation, not productivity.

Where we are · midpoint

What's built.

- ✓ *Design system* — locked. A complete, calm visual language.
- ✓ *Interaction model* — prototyped and clickable. The full spine works end to end: check in, map a sensation, name a part, see it on the dashboard.
- ✓ *Body map* — freeform tapping with colour, texture, movement.
- ✓ *Naming flow* — user-controlled part creation.

Working prototype, end to end

What's next

From midpoint to demo.

- Generated character art for each part.
- Guided voice check-in (2–3 min).
- Window-of-tolerance modelling from real check-in data.
- Longitudinal trends across parts.
